

Service level objectives

The API availability objective is 99.9 percent per calendar month, excluding approved maintenance. The primary health indicator is successful authenticated API requests, not merely an open TCP port.

Background processing has a target of ninety-five percent of queued document jobs starting within five minutes. Monitor outbox delay, Celery failures, and repeated retries separately from document upload success.

Semantic retrieval quality is monitored through controlled evaluation queries and cited-answer review. A Qdrant outage degrades search but does not change PostgreSQL authoritative access or document state.
