

Release readiness checklist

Before release, confirm code review, unit tests, Docker image build, static Alembic upgrade SQL, and the complete Compose startup path. A failed migration or test blocks release.

For changes to retrieval or chat, run a controlled query against indexed synthetic documents. Verify that citations name only retrieved sources and that an insufficient-context question makes no model request.

After release, check health, one authorized API call, worker readiness, migration head, and error logs. Keep a tested rollback plan for every schema or authorization change.
